

Fanny Mossberg

My name is Fanny Mossberg, and I am a PhD student in didactics at the Gifted doctoral programme, Mälardalen University (MDU). In short, didactics is a field of knowledge about teaching. I will focus my PhD research and education on inclusive education. For example, how contextual factors influence identification, learning and teaching of gifted and talented children and students/highly able children and students in the Swedish preschool and school system. One more focus is experiences of parents to gifted and talented children and students/highly able children and students in the Swedish preschool and school system. Moreover, the focus is experiences of young gifted and talented adults who have attended the Swedish preschool and school system. I will conduct a literature review, a multiple case study and two interview studies. One with parents and one with young adults. I will present my research results in a thesis, research articles and at international and national conferences. The results can form a basis for important discussions and development work in preschools and schools. My PhD studies have relevance for head teachers and teachers in preschool and school, teacher educators and teacher students, parents and others interested in identification, contextual influences, and experiences of the Swedish preschool and school system.

Please, do not hesitate to contact me if you are interested in my research work or would like to take part.
